Date : *17/11/2011*

Endoscopy Ultrasound:

Endoscopic ultrasound was performed under deep sedation patient tolerated the procedure well with no immediate complications.

OGD was performed prior to EUS and showed post pyloric ulcer and the plastic stent seen in place.

The study was performed through the gastric wall, it was difficult to enter to the duodenum by echoendoscope. The pancreatic body and tail appear hypoechoic and the plastic stent seen in main pancreatic which is not dilated, there is evidence of what it seems to be a side branch dilated duct adjacent to small hypoechoic lesion.

The splenic vein is not patent most likely due to thrombus.

Gross thickening of distal gastric and post pyloric duodenal wall.

Small gastric body varices was seen.

EUS-FNA was performed to peripancreatic hypoechoic area and thick gastric wall.

Samir Oweis MD
Gastroenterologist
Interventional therapy & EUS
